

推廣教育資料結構與演算法 Topic 7 圖論

Kuan-Teng Liao (廖冠登) 2021/06/12

大綱

最小生成 樹 最短距離 循環偵測 概論 BFS& DFS 貪婪法

圖論(Graph) (1)

- •何謂圖(graph)
 - ✓定義
 - 為頂/端點V(vertex)與邊線E(edge)所形成的集合,因此圖可以表示成G(V,E)
 - ✓特色
 - 跟樹很像,在圖論中,強調的是點與點之間的連通(不是人與人之間的連結),因此 跟樹比較,圖論不一定會有與可能會有部分如下表所示

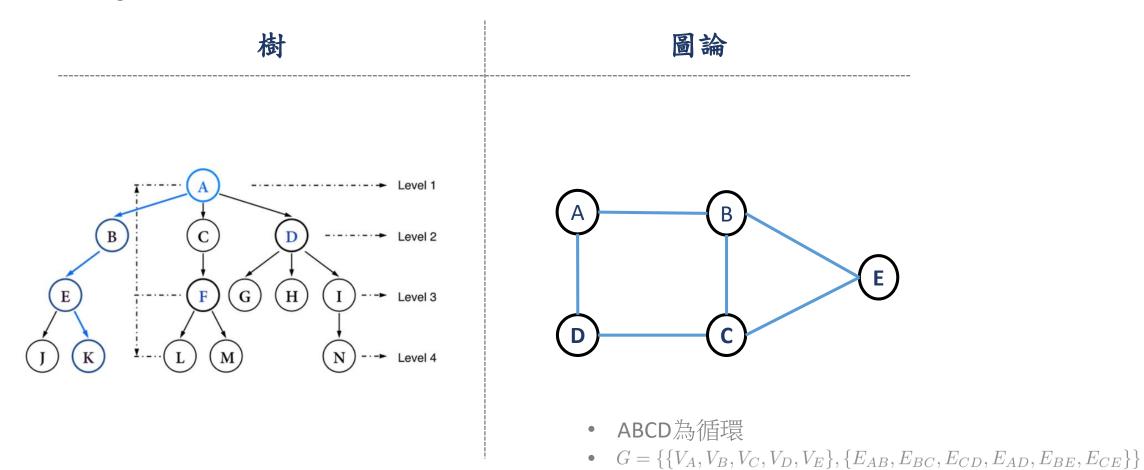

- 必有根結點
- 每一個節點下都可以由彼此互斥 允許循環產生
- 只允許子節點來源只有一個父節點

- 不一定有根結點
- 邊與點允許構成循環(cycle)
- (disjoint)的子樹與節點構成,因此不 :• 允許子端點於來源,可以來自不同 父節點

圖論(Graph) (2)

• E.g.,

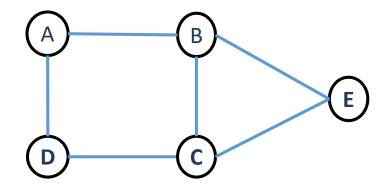

• 到E可以來自B或 C點

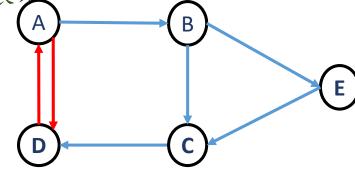

圖論(Graph) (3)

- 一般來說,圖的種類有
 - ✓無向圖
 - 即邊可代表兩端點可以互相連通

✓有向圖

• 即邊具有方向性代表只能從一端點至另一端點,而另一端點無法回至原端點;該邊會以箭號表示

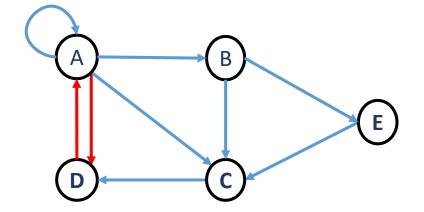

圖論(Graph) (4)

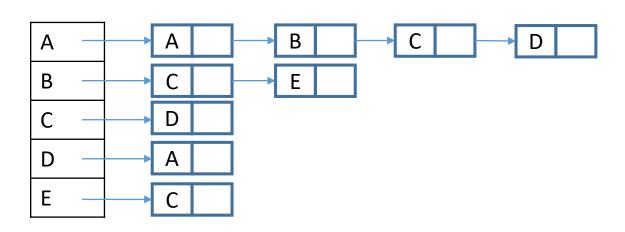

- 學圖論時需要了解以下術語
 - ✓相鄰(adjacent): vertex(A)與vertex(B)之間有一條edge;不論方向性
 - ✓路徑(path):從vertex(A)到vertex(B),藉由edge所經過的所有vertex的edge
 - √長度/距離(length/distance): path中, edge的數目
 - ✓簡單路徑(simple path):若一條path中,除了起點vertex與終點vertex之外, 沒有vertex被重複經過,則稱這條path為簡單路徑
 - ✓循環(cycle):若有一條「簡單路徑」的起點vertex與終點vertex相同
 - ✓權重(weight):於邊上可以註記述值,作為兩點之間的距離或是其他意義
 - ✓自我迴圈(self-loop):若有edge從vertex(A)指向vertex(A),即稱為self-edge或是self-loop

圖論(Graph) (2)

- · 圖學vs.資料結構
 - ✓實作方法
 - 鄰近串列(Adjacency list)

圖論(Graph) (3)

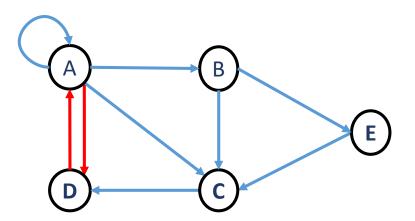

main.cpp

```
main.cpp
   #include <algorithm>
   #include <iostream>
                                                                    21
                                                                            public: bool fn_InsVet(char c_NameA, char c_NameB){
                                                                    22
                                                                                 int i_Ind = -1;
                                                                                 for (int i_Ct= 0; i_Ct < i_Size; i_Ct++){
   struct Vet{
        public: char c_Name;
                                                                                     if(c_NameA = cp_Name[i_Ct])
                                                                                         i_Ind = i_Ct;
        public: Vet* clsp_Ptr;
                                                                    25
                                                                    26
                                                                                          break;
                                                                    27

圖論(Graph) (8)

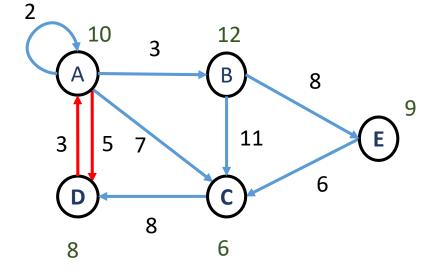

• 相鄰串列與相鄰陣列法比較

	相鄰串列	相鄰陣列
差異點	 使用結構配合一維陣列再搭配串列可生成 不會發生稀疏矩陣的狀態 時間複雜度為 O(V + E), V 為圖中點的數目, E為圖中邊線的個數 若每條邊有其權重,可以於結構內設計欄位(p. 14左圖) 若每個點有其權重,可以於結構內設計欄位(p. 14右圖) 	 使用二維陣列即可生成 會出現稀疏矩陣的狀況 時間複雜度為 O(V²), V為圖中點的數目 若每條邊有其權重,可以於陣列內內儲存邊的權重(p. 14左圖) 若每個點有其權重,需變形或另外產生其他儲存的方法(p. 14右圖)

圖論(Graph) (8)

練習 7-1(1)

- 有一個小鎮,需要找出該小鎮是否有法官。假設今天有N個人編號為1至N,裡面若有法官則回傳人員編號否則回傳-1,法官與非法官的條件如下
 - ✓法官不會相信任何人
 - ✓除了法官本人,非法官的普通人會相信法官
 - ✓最多只會有一個法官滿足上述條件
- 輸入, 共*m*+1列
 - ✓第一列有兩個輸入分別為N個人,接一空白後輸入代表接下來有m條關聯
 - √每條關聯皆有兩個輸入,輸入間以空白隔開
 - E.g., 12 代表 1號人信任2號人
- 輸出
 - ✓輸出是法官的人員編號

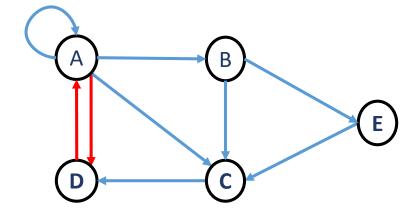

練習 7-1(2)

輸入	輸出
2 1	2
1 2	
3 2	3
13	
2 3	
3 3	-1
13	
2 3	
3 1

圖論—最短距離議題(9)

- 最短距離(cont'd)
 - ✓又稱Dijkstra's algorithm(找出最短距離方法)
 - ✓時間複雜度,為 $O(V^2)$
- Dijkstra's algorithm法,真正解法
 - ✓可参考https://www.youtube.com/watch?v=Lfb8qkXzHY0
 - ✓注意
 - 邊的權重不可有負值
 - · 屬於貪婪法(greedy)內的一種,因為每次計算都在算在當下最好的情況距離

圖論—最短距離議題(10)

Dijkstra's Rules

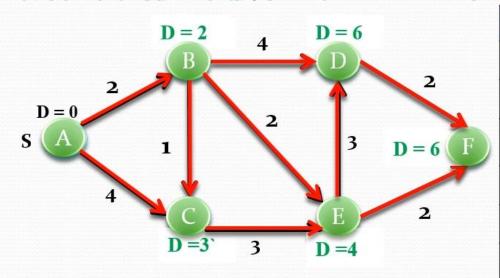

Rule 1: Make sure there is no negative edges. Set distance to source vertex as zero and set all other distances to infinity.

Rule 2: Relax all vertices adjacent to the current vertex.

Rule 3: Choose the closest vertex as next current vertex.

Rule 4: Repeat Rule 2 and Rule 3 until the queue or reach the destination.

If (D[C] + D[AdjEdge]) < D[Adj] {Update Adj's D with new shortest path}

Q <= V	A	В	С	D	E	F
A	0 ^A	2 ^A	4 ^A	∞ ^A	∞ A	∞ A
B	0 ^A	2 ^A	3 ^B	6 ^B	4 ^B	∞ ^A
C	0 ^A	2 ^A	3 ^B	6 ^B	4 ^B	∞ A
E	0 ^A	2 ^A	3 ^B	6 ^B	4 ^B	6 ^E
(D)	0 ^A	2 ^A	3 ^B	6 ^B	4 ^B	6 ^E
F	0 ^A	2 ^A	3 ^B	6 ^B	4 ^B	6 ^E

圖論—最短距離議題(11)

• Dijkstra's algorithm法,時間複雜度 ✓ O(n²)

貪婪法(Greedy) (1)

- 是一種在每一步選擇中都採取在當前狀態下最好或最佳(即最有利)的選擇,從而希望導致結果是最好或最佳的演算法
- 但整體來看,利用貪婪法的結果「不一定為最好的結果」
- 貪婪演算法與動態規劃的不同在於它對每個子問題的解決方案都做出選擇,不能回退。動態規劃則會儲存以前的運算結果,並根據以前的結果對當前進行選擇,有回退功能。
- 思路
 - ✓在每一步選擇中都採取在當前狀態下最好或最佳
 - E.g., 最短路徑中, 每次都選最短的路徑的點來走
 - E.g. 換硬幣使的硬幣數換完後最少,一定從幣值大的開始換

貪婪法(Greedy)(2)

✓E.g.,

- 要把 n 個 1 元硬幣兌換成 50 元, 10 元, 5 元, 1 元硬幣, 如何兌換可以讓最終的硬幣 數最少?
 - 使用貪婪法一定先從能兌換面額最多的開始兌換,這樣使的硬幣數最少
- 同樣問題把幣額改成25元,18元,5元,1元硬幣
 - 若n=41, 貪婪法會得到: 25*1+18*0+5*3+1*1
 - 若n=41,但是最佳解是: 25*0+18*2+5*1+1*1

• 結論

- ✓ 所以當只問最佳解,並不管整體結果時,單用貪婪法會比較好
- ✓若要達到整體最佳解,則需要要用動態規劃

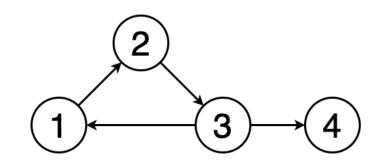

圖論—循環檢測議題(1)

- 循環檢測 (Cycle detection)
 - ✓若為單純的Linked List
 - 可使用Floyd's Algorithm
 - 又名「龜兔賽跑法」 Tortoise and Hare Algorithm
 - 用來檢驗一張圖裝是否存在循環
 - 使用方法:兩個指標,一個移動1一個移動2

✓若為圖

• 使用DFS方法進行檢測

圖論—循環檢測議題(2)

• 循環檢測 (Cycle detection) (cont'd)

```

圖論—最小生成樹議題(1)

- 生成樹Spanning Tree
 - ✓從一張圖取出一棵樹
 - 有許多種可能
 - 左邊為原圖,右邊為從圖取出的樹

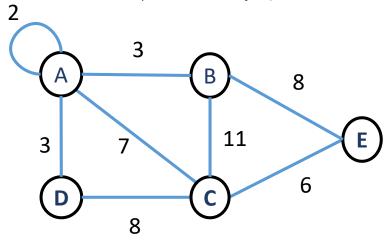

圖論—最小生成樹議題(2)

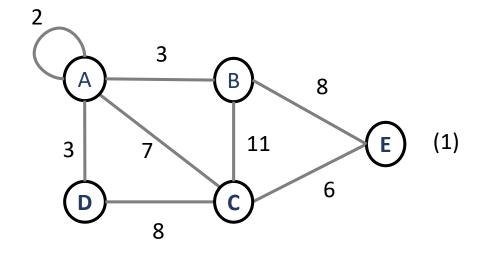

- 最小生成樹Minimum Spanning Tree
 - ✓一般來說在圖論中,除了描述關係外,也會呈現每個關係的權重(如左圖)
 - 假設左圖為公司網路連線所需耗費的電力,找出最小生成樹即代表,找出最少耗費並可連接所有點之狀樹狀架構,此架構將會耗費最少產能。
 - 因此找出公司網路穩定所需最少的電力
 - ✓一般來說,為求出經過所有點所需最小的權重

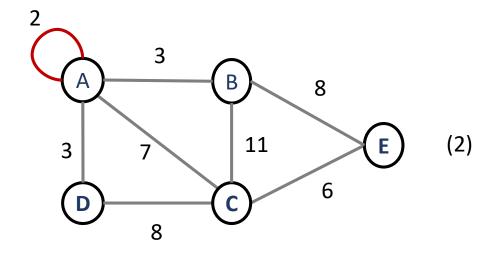

圖論—最小生成樹議題(2)

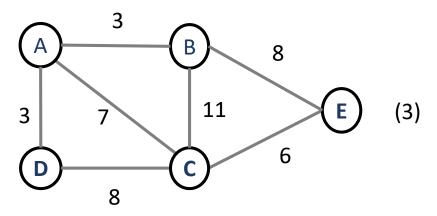

- 最小生成樹Minimum Spanning Tree (cont'd)
 - ✓想法(Kruskal's Algorithm)
 - 將所有權重由小到大排序
 - · 依序加入,但每次加入後不可行成「環(cycle)」
 - 若形成環,則放棄該條加入
